Daniel Graham - Mobile App Development Summer Session 3.

Project Proposal

App Name: Headin'

Idea:

Headin' is a location-based social app that helps users share and discover real-time events, hangouts, and gatherings in their area. Whether it's a local concert, a popular bar night, or a casual park meetup, users can quickly post where they're headed or what's happening nearby. The app solves the problem of FOMO (fear of missing out) and disconnected social planning by providing a live feed of where people are going and what's trending socially. It also helps users plan their schedules and hopefully encourages people to be more social, meet new people, and make connections in a more passive and natural way.

25 Day Plan:

Day 1: Initialize React Native project with Expo, TypeScript, and basic folder structure. Setup GitHub repo.
Day 2: Set up navigation menu. Create screens: Home, Event Feed, Post Event, Profile.
Day 3: Design splash screen and onboarding walkthrough (static for now)
Day 4: Integrate Firebase Auth (email login + guest login). Build login/signup screens.
Day 5: Set up Firestore database structure (Users, Events, Likes, Comments). Start event feed screen with static dummy data.
Day 6: Implement responsive card UI for event previews. Add basic FlatList rendering for feed.
Day 7: Add user profile screen with mock data (username, bio, profile picture, events posted).
Day 8: Set up tools for photo uploads. Allow event images during post creation.
Day 9: Implement Firebase Storage for uploading images. Store URLs in event documents.
Day 10: Add form UI to post events (title, description, date/time, tags).
Day 11: Integrate features to capture the user's current location on post submission.

Day 12: Integrate google maps API to show pins for all posted events near user.

Day 13: Tapping a pin opens event modal/card. Connect map with event data from Firestore.

Day 14: Add category filter (e.g., bar, park, party, music). Use buttons or chips for quick filtering.

Day 15: Add ability to like/save events. Save these to user's profile.

Day 16: Add comments to events using a simple Firestore subcollection per event.

Day 17: Implement notifications to send push notifications when friends post or someone comments.

Day 18: Let users update their profile info (bio, username, pic). Store in Firebase.

Day 19: Add friend/follow feature (store following list in Firestore).

Day 20: Add toggle to show only friends' events in the feed.

Day 21: Add time-sensitive filtering (e.g., "tonight", "this weekend").

Day 22: Test app using WSA. Fix layout/UX bugs.

Day 23: Add loading indicators, error handling, and confirmation modals.

Day 24: Polish design (spacing, typography, consistent colors). Use a style system or Tailwind

Day 25: Create build via Expo, write simple README/landing page, and prepare to publish to TestFlight / Google Play (internal testing). Submit Apk file to submission page.
